Discover More about the DAS-C01 Certification

Are you interested in passing the AWS DAS-C01 exam? First discover, who benefits from the DAS-C01 certification. The DAS-C01 is suitable for a candidate if he wants to learn about Specialty. Passing the DAS-C01 exam earns you the AWS Certified Data Analytics - Specialty title.

While preparing for the DAS-C01 exam, many candidates struggle to get the necessary materials. But do not worry; your struggling days are over. The DAS-C01 PDF contains some of the most valuable preparation tips and the details and instant access to useful <u>DAS-C01 study materials just at one click</u>.

AWS DAS-C01 Data Analytics Specialty Certification Details:

Exam Name	AWS Certified Data Analytics - Specialty (Data Analytics
	Specialty)
Exam Code	DAS-C01
Exam Price	\$300 USD
Duration	180 minutes
Number of Questions	65
Passing Score	750 / 1000
Recommended	Data Analytics Fundamentals
Training / Books	Big Data on AWS
Schedule Exam	AWS Certification
Sample Questions	AWS DAS-C01 Sample Questions
Recommended	AWS Certified Data Analytics - Specialty Practice
Practice	<u>Test</u>

DAS-C01 Syllabus:

Section	Objectives
Collection - 18%	
Determine the	- Evaluate that the data loss is within tolerance limits in the
operational	event of failures - Evaluate costs associated with data acquisition, transfer, and
characteristics of	provisioning from various sources into the collection system

Section	Objectives
the collection	(e.g., networking, bandwidth, ETL/data migration costs)
system	- Assess the failure scenarios that the collection system may
	undergo, and take remediation actions based on impact
	- Determine data persistence at various points of data capture
	- Identify the latency characteristics of the collection system
	- Describe and characterize the volume and flow characteristics
	of incoming data (streaming, transactional, batch)
Select a collection	- Match flow characteristics of data to potential solutions
system that	- Assess the tradeoffs between various ingestion services
handles the	taking into account scalability, cost, fault tolerance, latency,
frequency,	etc.
volume, and the	- Explain the throughput capability of a variety of different
source of data	types of data collection and identify bottlenecks
	- Choose a collection solution that satisfies connectivity
	constraints of the source data system
Select a collection	- Describe how to capture data changes at the source
system that	- Discuss data structure and format, compression applied, and
addresses the key	encryption requirements
properties of data,	- Distinguish the impact of out-of-order delivery of data,
such as order,	duplicate delivery of data, and the tradeoffs between at-most-
format, and	once, exactly-once, and at-least-once processing
compression	- Describe how to transform and filter data during the
compression	collection process
Storage and Data Management - 22%	
	- Determine the appropriate storage service(s) on the basis of
Determine the	cost vs. performance
operational	- Understand the durability, reliability, and latency
characteristics of	characteristics of the storage solution based on requirements
the storage	- Determine the requirements of a system for strong vs.
solution for	eventual consistency of the storage system
analytics	- Determine the appropriate storage solution to address data
	freshness requirements

Section	Objectives
	- Determine the appropriate storage solution based on update
	patterns (e.g., bulk, transactional, micro batching)
	- Determine the appropriate storage solution based on access
	patterns (e.g., sequential vs. random access, continuous usage
	vs.ad hoc)
Determine data	- Determine the appropriate storage solution to address
_	change characteristics of data (appendonly changes vs.
access and retrieval patterns	updates)
retrievai patterns	- Determine the appropriate storage solution for long-term
	storage vs. transient storage
	- Determine the appropriate storage solution for structured vs.
	semi-structured data
	- Determine the appropriate storage solution to address query
	latency requirements
	- Determine appropriate mechanisms to address schema
	evolution requirements
	- Select the storage format for the task
	- Select the compression/encoding strategies for the chosen
Select appropriate	storage format
data layout,	- Select the data sorting and distribution strategies and the
schema, structure,	storage layout for efficient data access
and format	- Explain the cost and performance implications of different
	data distributions, layouts, and formats (e.g., size and number
	of files)
	- Implement data formatting and partitioning schemes for
	data-optimized analysis
Define data	- Determine the strategy to address data lifecycle
lifecycle based on	requirements
usage patterns	- Apply the lifecycle and data retention policies to different
and business	storage solutions
requirements	
Determine the	- Evaluate mechanisms for discovery of new and updated data
appropriate	sources
system for	- Evaluate mechanisms for creating and updating data catalogs

Section	Objectives	
cataloging data	and metadata	
and managing	- Explain mechanisms for searching and retrieving data	
metadata	catalogs and metadata	
	- Explain mechanisms for tagging and classifying data	
Processing - 24%		
Determine	- Understand data preparation and usage requirements	
appropriate data	- Understand different types of data sources and targets	
processing	- Evaluate performance and orchestration needs	
solution	- Evaluate appropriate services for cost, scalability, and	
requirements	availability	
	- Apply appropriate ETL/ELT techniques for batch and real-time	
	workloads	
Design a solution	- Implement failover, scaling, and replication mechanisms	
for transforming	- Implement techniques to address concurrency needs	
and preparing	- Implement techniques to improve cost-optimization	
data for analysis	efficiencies	
	- Apply orchestration workflows	
	- Aggregate and enrich data for downstream consumption	
Automate and	- Implement automated techniques for repeatable workflows	
operationalize	- Apply methods to identify and recover from processing	
data processing	failures	
solutions	- Deploy logging and monitoring solutions to enable auditing and traceability	
Analysis and Visualization - 18%		
	- Determine costs associated with analysis and visualization	
Determine the	- Determine scalability associated with analysis	
operational	- Determine failover recovery and fault tolerance within the	
characteristics of	RPO/RTO	
the analysis and	- Determine the availability characteristics of an analysis tool	
visualization	- Evaluate dynamic, interactive, and static presentations of	
solution	data	
	- Translate performance requirements to an appropriate	

Section	Objectives
	visualization approach (pre-compute and consume static data
	vs. consume dynamic data)
Select the	
appropriate data	- Evaluate and compare analysis solutions
analysis solution	- Select the right type of analysis based on the customer use
for a given	case (streaming, interactive, collaborative, operational)
scenario	
Select the appropriate data visualization solution for a given scenario	 Evaluate output capabilities for a given analysis solution (metrics, KPIs, tabular, API) Choose the appropriate method for data delivery (e.g., web, mobile, email, collaborative notebooks) Choose and define the appropriate data refresh schedule Choose appropriate tools for different data freshness requirements (e.g., Amazon Elasticsearch Service vs. Amazon QuickSight vs. Amazon EMR notebooks) Understand the capabilities of visualization tools for interactive use cases (e.g., drill down, drill through and pivot) Implement the appropriate data access mechanism (e.g., in memory vs. direct access) Implement an integrated solution from multiple
	heterogeneous data sources
	Security - 18%
	- Implement appropriate authentication methods (e.g.,
Select appropriate	federated access, SSO, IAM)
authentication and	- Implement appropriate authorization methods (e.g., policies,
authorization	ACL, table/column level permissions)
mechanisms	- Implement appropriate access control mechanisms (e.g.,
	security groups, role-based control)
Apply data protection and	 Determine data encryption and masking needs Apply different encryption approaches (server-side encryption, client-side encryption, AWS KMS, AWS CloudHSM)
encryption techniques	Implement at-rest and in-transit encryption mechanismsImplement data obfuscation and masking techniques

Section	Objectives
	- Apply basic principles of key rotation and secrets management
Apply data governance and compliance controls	 Determine data governance and compliance requirements Understand and configure access and audit logging across data analytics services Implement appropriate controls to meet compliance requirements

Broaden Your Knowledge with AWS DAS-C01 Sample Questions:

Question: 1

A data engineer needs to create a dashboard to display social media trends during the last hour of a large company event. The dashboard needs to display the associated metrics with a consistent latency of less than 2 minutes.

Which solution meets these requirements?

- a) Publish the raw social media data to an Amazon Kinesis Data Firehose delivery stream. Use Kinesis Data Analytics for SQL Applications to perform a sliding window analysis to compute the metrics and output the results to a Kinesis Data Streams data stream. Configure an AWS Lambda function to save the stream data to an Amazon DynamoDB table. Deploy a real-time dashboard hosted in an Amazon S3 bucket to read and display the metrics data stored in the DynamoDB table.
- b) Publish the raw social media data to an Amazon Kinesis Data Firehose delivery stream. Configure the stream to deliver the data to an Amazon Elasticsearch Service cluster with a buffer interval of 0 seconds. Use Kibana to perform the analysis and display the results.
- c) Publish the raw social media data to an Amazon Kinesis Data Streams data stream. Configure an AWS Lambda function to compute the metrics on the stream data and save the results in an Amazon S3 bucket. Configure a dashboard in Amazon QuickSight to query the data using Amazon Athena and display the results.
- d) Publish the raw social media data to an Amazon SNS topic. Subscribe an Amazon SQS queue to the topic. Configure Amazon EC2 instances as workers to poll the queue, compute the metrics, and save the results to an Amazon Aurora MySQL database. Configure a dashboard in Amazon QuickSight to query the data in Aurora and display the results.

Answer: a

A company is providing analytics services to its marketing and human resources (HR) departments. The departments can only access the data through their business intelligence (BI) tools, which run Presto queries on an Amazon EMR cluster that uses the EMR File System (EMRFS).

The marketing data analyst must be granted access to the advertising table only. The HR data analyst must be granted access to the personnel table only.

Which approach will satisfy these requirements?

- a) Create separate IAM roles for the marketing and HR users. Assign the roles with AWS Glue resourcebased policies to access their corresponding tables in the AWS Glue Data Catalog. Configure Presto to use the AWS Glue Data Catalog as the Apache Hive metastore.
- b) Create the marketing and HR users in Apache Ranger. Create separate policies that allow access to the user's corresponding table only. Configure Presto to use Apache Ranger and an external Apache Hive metastore running in Amazon RDS.
- c) Create separate IAM roles for the marketing and HR users. Configure EMR to use IAM roles for EMRFS access. Create a separate bucket for the HR and marketing data. Assign appropriate permissions so the users will only see their corresponding datasets.
- d) Create the marketing and HR users in Apache Ranger. Create separate policies that allows access to the user's corresponding table only. Configure Presto to use Apache Ranger and the AWS Glue Data Catalog as the Apache Hive metastore.

Answer: a

Question: 3

A real estate company is receiving new property listing data from its agents through .csv files every day and storing these files in Amazon S3.

The data analytics team created an Amazon QuickSight visualization report that uses a dataset imported from the S3 files. The data analytics team wants the visualization report to reflect the current data up to the previous day.

How can a data analyst meet these requirements?

- a) Schedule an AWS Lambda function to drop and re-create the dataset daily.
- b) Configure the visualization to query the data in Amazon S3 directly without loading the data into SPICE.
- c) Schedule the dataset to refresh daily.
- d) Close and open the Amazon QuickSight visualization.

Answer: c

An online retail company wants to perform analytics on data in large Amazon S3 objects using Amazon EMR.

An Apache Spark job repeatedly queries the same data to populate an analytics dashboard. The analytics team wants to minimize the time to load the data and create the dashboard.

Which approaches could improve the performance?

(Select TWO.)

- a) Copy the source data into Amazon Redshift and rewrite the Apache Spark code to create analytical reports by querying Amazon Redshift.
- b) Copy the source data from Amazon S3 into Hadoop Distributed File System (HDFS) using s3distcp.
- c) Load the data into Spark DataFrames.
- d) Stream the data into Amazon Kinesis and use the Kinesis Connector Library (KCL) in multiple Spark jobs to perform analytical jobs.
- e) Use Amazon S3 Select to retrieve the data necessary for the dashboards from the S3 objects.

Answer: c, e

Question: 5

A company needs to implement a near-real-time fraud prevention feature for its ecommerce site.

User and order details need to be delivered to an Amazon SageMaker endpoint to flag suspected fraud. The amount of input data needed for the inference could be as much as 1.5 MB.

Which solution meets the requirements with the LOWEST overall latency?

- a) Create an Amazon Managed Streaming for Kafka cluster and ingest the data for each order into a topic. Use a Kafka consumer running on Amazon EC2 instances to read these messages and invoke the Amazon SageMaker endpoint.
- b) Create an Amazon Kinesis Data Streams stream and ingest the data for each order into the stream. Create an AWS Lambda function to read these messages and invoke the Amazon SageMaker endpoint.
- c) Create an Amazon Kinesis Data Firehose delivery stream and ingest the data for each order into the stream. Configure Kinesis Data Firehose to deliver the data to an Amazon S3 bucket. Trigger an AWS Lambda function with an S3 event notification to read the data and invoke the Amazon SageMaker endpoint.
- d) Create an Amazon SNS topic and publish the data for each order to the topic. Subscribe the Amazon SageMaker endpoint to the SNS topic.

Answer: a

A company is currently using Amazon DynamoDB as the database for a user support application.

The company is developing a new version of the application that will store a PDF file for each support case ranging in size from 1–10 MB. The file should be retrievable whenever the case is accessed in the application.

How can the company store the file in the MOST cost-effective manner?

- a) Store the file in Amazon DocumentDB and the document ID as an attribute in the DynamoDB table.
- b) Store the file in Amazon S3 and the object key as an attribute in the DynamoDB table.
- c) Split the file into smaller parts and store the parts as multiple items in a separate DynamoDB table.
- d) Store the file as an attribute in the DynamoDB table using Base64 encoding.

Answer: b

Question: 7

A company ingests a large set of clickstream data in nested JSON format from different sources and stores it in Amazon S3.

Data analysts need to analyze this data in combination with data stored in an Amazon Redshift cluster. Data analysts want to build a cost-effective and automated solution for this need.

Which solution meets these requirements?

- a) Use Apache Spark SQL on Amazon EMR to convert the clickstream data to a tabular format. Use the Amazon Redshift COPY command to load the data into the Amazon Redshift cluster.
- b) Use AWS Lambda to convert the data to a tabular format and write it to Amazon S3. Use the Amazon Redshift COPY command to load the data into the Amazon Redshift cluster.
- c) Use the Relationalize class in an AWS Glue ETL job to transform the data and write the data back to Amazon S3. Use Amazon Redshift Spectrum to create external tables and join with the internal tables.
- d) Use the Amazon Redshift COPY command to move the clickstream data directly into new tables in the Amazon Redshift cluster.

Answer: c

A publisher website captures user activity and sends clickstream data to Amazon Kinesis Data Streams.

The publisher wants to design a cost-effective solution to process the data to create a timeline of user activity within a session. The solution must be able to scale depending on the number of active sessions.

Which solution meets these requirements?

- a) Include a variable in the clickstream data from the publisher website to maintain a counter for the number of active user sessions. Use a timestamp for the partition key for the stream. Configure the consumer application to read the data from the stream and change the number of processor threads based upon the counter. Deploy the consumer application on Amazon EC2 instances in an EC2 Auto Scaling group.
- b) Include a variable in the clickstream to maintain a counter for each user action during their session. Use the action type as the partition key for the stream. Use the Kinesis Client Library (KCL) in the consumer application to retrieve the data from the stream and perform the processing. Configure the consumer application to read the data from the stream and change the number of processor threads based upon the counter. Deploy the consumer application on AWS Lambda.
- c) Include a session identifier in the clickstream data from the publisher website and use as the partition key for the stream. Use the Kinesis Client Library (KCL) in the consumer application to retrieve the data from the stream and perform the processing. Deploy the consumer application on Amazon EC2 instances in an EC2 Auto Scaling group. Use an AWS Lambda function to reshard the stream based upon Amazon CloudWatch alarms.
- d) Include a variable in the clickstream data from the publisher website to maintain a counter for the number of active user sessions. Use a timestamp for the partition key for the stream. Configure the consumer application to read the data from the stream and change the number of processor threads based upon the counter. Deploy the consumer application on AWS Lambda.

Answer: c

A financial company uses Amazon EMR for its analytics workloads. During the company's annual security audit, the security team determined that none of the EMR clusters' root volumes are encrypted. The security team recommends the company encrypt its EMR clusters' root volume as soon as possible.

Which solution would meet these requirements?

- a) Enable at-rest encryption for EMR File System (EMRFS) data in Amazon S3 in a security configuration. Re-create the cluster using the newly created security configuration.
- b) Specify local disk encryption in a security configuration. Re-create the cluster using the newly created security configuration.
- c) Detach the Amazon EBS volumes from the master node. Encrypt the EBS volume and attach it back to the master node.
- d) Re-create the EMR cluster with LZO encryption enabled on all volumes.

Answer: b

Question: 10

A media company is migrating its on-premises legacy Hadoop cluster with its associated data processing scripts and workflow to an Amazon EMR environment running the latest Hadoop release. The developers want to reuse the Java code that was written for data processing jobs for the on-premises cluster.

Which approach meets these requirements?

- a) Deploy the existing Oracle Java Archive as a custom bootstrap action and run the job on the EMR cluster.
- b) Compile the Java program for the desired Hadoop version and run it using a CUSTOM_JAR step on the EMR cluster.
- c) Submit the Java program as an Apache Hive or Apache Spark step for the EMR cluster.
- d) Use SSH to connect the master node of the EMR cluster and submit the Java program using the AWS CLI.

Answer: b

Avail the Study Guide to Pass AWS DAS-C01 Data Analytics Specialty Exam:

- Find out about the DAS-C01 syllabus topics. Visiting the official site offers an idea about the exam structure and other important study resources. Going through the syllabus topics help to plan the exam in an organized manner.
- Once you are done exploring the <u>DAS-C01 syllabus</u>, it is time to plan for studying and covering the syllabus topics from the core. Chalk out the best plan for yourself to cover each part of the syllabus in a hassle-free manner.
- A study schedule helps you to stay calm throughout your exam preparation. It should contain your materials and thoughts like study hours, number of topics for daily studying mentioned on it. The best bet to clear the exam is to follow your schedule rigorously.
- The candidate should not miss out on the scope to learn from the DAS-C01 training. Joining the AWS provided training for DAS-C01 exam helps a candidate to strengthen his practical knowledge base from the certification.
- Learning about the probable questions and gaining knowledge regarding the exam structure helps a lot. Go through the <u>DAS-C01 sample</u> <u>questions</u> and boost your knowledge
- Make yourself a pro through online practicing the syllabus topics. DAS-C01 practice tests would guide you on your strengths and weaknesses regarding the syllabus topics. Through rigorous practicing, you can improve the weaker sections too. Learn well about time management during exam and become confident gradually with practice tests.

Career Benefits:

 Passing the DAS-C01 exam, helps a candidate to prosper highly in his career. Having the certification on the resume adds to the candidate's benefit and helps to get the best opportunities.

Here Is the Trusted Practice Test for the DAS-C01 Certification

VMExam.Com is here with all the necessary details regarding the DAS-C01 exam. We provide authentic practice tests for the DAS-C01 exam. What do you gain from these practice tests? You get to experience the real exam-like questions made by industry experts and get a scope to improve your performance in the actual exam. Rely on VMExam.Com for rigorous, unlimited two-month attempts on the DAS-C01 practice tests, and gradually build your confidence. Rigorous practice made many aspirants successful and made their journey easy towards grabbing the AWS Certified Data Analytics - Specialty.

Start Online practice of DAS-C01 Exam by visiting URL
